agreement with the model of A. Granato and K. Lucke (J. App. Phys. v. 27, 583, 1956) for the amplitude-dependent absorption of ultrasound by dislocations. Most dislocations were found to be growth dislocations. Research is planned on the possibility of separating the electronic part of the absorption in its pure form and determination of the anisotropy of the energy gap, which preliminary estimates show to be lower than obtained from the present data. Orig. art. has: 2 figures.

Effect of Intermolecular Reaction on the Bromination Reaction in a
Binary Benzene - Nitrobenzene System

is accompanied by irreversible sulfonation. The solvating nitrobenzene medium which decreases the activation energy was considered to be the most favorable for benzene bromination reactions.

In the absence of a solvent the bromination reaction is maintained by thermal excitation. The initiating effect of bromobenzene as a polar solvent was demonstrated during the bromination of benzene and the kinetic curve of bromine reaction in the bromobenzene solution was perfectly similar to the curve of the nitrobenzene solution.

TITLE: Physico-chemical Investigations of the Sensitivity of the
Benzene Cycle to Polarizing Actions of the Solvent and the
Field of Force. I. Magneto-optical Examination of the
Intermolecular Interactions in Binary Nitrobenzene Systems
of the Alkyl-substituted Benzene Derivatives,

PERIODICAL: Zhurnal fizicheskoy khimii. 1960, Vol. 34, No. 10,
pp. 2190-2198

TEXT: Alkyl derivatives of benzene, polyphenyl hydrocarbons and acene
hydrocarbons were investigated in binary systems with nitrobenzene to
determine the influence of functional groups upon the polarizability of the
benzene cycle. The composition of the molecular compounds thus formed was
determined since from the difference in the composition of these compounds
it is possible to determine the varying intermolecular interaction.

Card 1/9

Physico-chemical Investigations of the Sensitivity of the Benzene Cycle to Polarizing Actions of the Solvent and the Field of Force. I. Magneto-optical Examination of the Intermolecular Interactions in Binary Nitrobenzene Systems of the Alkyl-substituted Benzene Derivatives

S/076/60/034/010/005/022
B015/B064

Various physico-chemical methods of analysis are applied to determine the composition of the molecular compounds. The authors are the first to publish experimental data of the magneto-optical examinations of the binary nitrobenzene systems with alkyl derivatives in benzene. By means of an electric apparatus containing a precision polarimeter as well as a M-19 (M-19) fluxmeter to measure the magnetic field, the diagrams of the dependence of the angle of rotation α_H^o of the polarization plane in the magnetic field on the composition of the binary system were plotted (Figs. 2-4), and the composition of the molecular compounds thus formed determined. The total picture of the curve "composition - α_H^o " shows that the components have no additive properties. The following rules were established: a prolongation of the n-alkyl chain is accompanied by an

increase of the dipole moment and the polarizability, and weakens the magneto-optical activity (Fig. 2, Curves 1-4). The cyclization of an n-butyl chain on the benzene cycle increases the magneto-optical activity (Fig. 3, Curves 1,2). A prolongation and cyclization of the alkyl groups in o-position changes the dipole moment and the magneto-optical activity (Fig. 3, Curves 2,3) only inconsiderably. A symmetrization of the methyl groups arranged around the benzene cycle eliminates polarization and weakens the magneto-optical activity (Fig. 3, Curves 4,5). A tertiary carbon atom increases the dipole moment and weakens the magneto-optical activity (Fig. 4, Curves 1,2). An isomerization of the butyl group weakens the magneto-optical activity (Fig. 2, Curve 4, Fig. 4, Curve 2). As a functional component of α -methyl naphthalene a diene system polarized by a methyl group increases the magneto-optical activity (Fig. 4, Curves 3,4)

Card 3/9

On the first ringing by the exchange effects in scattering reactions (0 recoil observables) and a theoretical effect of resonance scattering. I. V. V.

IZVESTIYA VUZ. FIZIKAL', 1959, Vol. 16, No. 5, pp. 650-653 (USSR)

Consideration of exchange effects in scattering reaction (Ref. 1-3) shows that besides the "common" stripping effect, two further processes must be dealt with: a) the knock-out effect, and b) "many" particle stripping. (Here 2-J₀) In reference 3 the problem concerning the determination of the stripping cross section was investigated by means of an analogous trial wave function. In the present (large the radius of investigation) for several simple cases, for the amplitudes of the processes it holds that

$$T_1 = T_2 = (n - 1)T_2 + (n - 1)T_1^*$$

T₁ → "common" stripping
T₂ → case a)
T₃ → case b)

On the Part Played by the Exchange Effects in Stripping Reactions

In the following a very complicated explicit equation is given for the amplitude equality of process b), T₂ = T₃.

For the cases a) J = 1, J = 1/2, J₁ = 1, T₁ = 0 (J₀-coupling)
b) J = 1, L₁ = 0, S₁ = 1, T₁ = 0 (L₀-coupling)
c) J = 0, J₀ = 1, T₁ = 0

and some special reactions the reaction parameters are then calculated; ten diagrams very clearly show the calculated curves. Figure 1 shows the differential cross section of the reaction $^{31}\text{P}(d, \alpha)^{29}\text{Si}$ in the angular range from 0 to 60°, both for common stripping and for the knock-out effect. Figure 2 shows the angular dependence of the differential cross section of the reaction

$$d\sigma/d\Omega_{\alpha} \propto 14$$

Card 2/3

Exchange Effects in Stripping Reactions

via the curves for common stripping, knock out (J₀-coupling), knock out (L₀-coupling), and the stripping of heavy particles, in all cases in the range $0 \leq \theta \leq 100^\circ$. There are 2 figures and 10 references, 2 of which are Soviet.

Vol. 39, No. 4(10), pp. 923-928

TEXT: The purpose of the present work was to study the angular distribution of alpha particles produced by 5.1 - 6.5 Mev protons in the reaction $F^{19}(p,\alpha)O^{16}$. The protons were obtained by accelerating molecular hydrogen in the 120-cm cyclotron at the authors' institute. The experimental arrangement is shown in Fig. 1. The proton energy was measured by slowing them in an aluminum foil (10.5μ). The particles produced in the reaction were recorded by a telescope consisting of three proportional counters. The counters were arranged in a chamber which could be rotated round the target from 0 to 160° . A pulse height analyzer (Fig. 2) was used to separate the alpha particles from the protons. Fig. 3 shows the energy spectrum of alpha particles emitted at 30° when a

fluoroplastic target is bombarded with 6.6-Mev protons. The angular distribution of long range particles produced in the reaction $F^{19}(p,\alpha)O^{16}$ and corresponding to the formation of O^{16} nucleus in the ground state ($Q_0 = 8.12$ Mev) was measured for eleven proton energies between 5.15 and 6.68 Mev. The results in the center of mass system are represented in Fig. 4. All the observed angular distributions were strongly anisotropic. The angular distributions obtained experimentally are compared with those calculated on the assumption of direct processes in Fig. 5. The strong dependence of the angular distribution on the proton energy indicates that the mechanism of reaction plays a decisive role. From the study of cross sections and differential cross sections for 30, 90, and 150° (Fig. 6), the authors conclude that when the proton energies lie between 5.1 and 6.5 Mev no particular mechanism of reaction is predominant; direct processes as well as the formation of compound nuclei takes place in this range. The authors thank B. V. Devichev for help in the work. There are 6 figures and 10 non-Soviet references.

TITLE Investigation of α -particle angular distribution in $\text{Li}^7(p,\alpha)\text{He}^4$
reactions

PERIODICAL *Zhurnal eksperimental'noi i teoreticheskoy fiziki*, v. 42, no. 4,
1962, 353 - 357

TEXT. The angular distributions of the α -particles from $\text{Li}^7(p,\alpha)\text{He}^4$ reactions were measured in the range $20 - 160^\circ$ for $E_p = 5.78, 6.15$ and 6.55 Mev using a telescope arrangement of three proportional counters, and Li_2CO_3 targets $0.16, 0.52$, and 0.92 mg/cm^2 thick corresponding to energy losses of 6-Mev protons of $5, 41$ and 70 kev. The angular distributions were obtained as $d\sigma/d\Omega = (\sigma/4\pi)[1 + A_2 P_2(x) + A_4 P_4(x)]$ with \checkmark

Card 1/3

S/056/62/042/002/007/055

Investigation of α -particle...

| E_p , Mev | a_2 | A_2 | A_4 |
|-------------|--------|--------|--------|
| 6.35 | -0.169 | -0.167 | -0.102 |
| 6.45 | -0.357 | -0.356 | -0.010 |
| 6.78 | -0.717 | -0.693 | +0.085 |

σ is the total cross section. The experimental results are satisfactorily described, even by $d\sigma/d\Omega \propto A_2 P_2(\chi)$. The excitation curves were measured for $5.25 \leq E_p \leq 6.55$ Mev (angle of α -particle emission: 30° - or, in the c.m.s. 55°) and for $5.3 \leq E_p \leq 6.55$ Mev (80° or 90° in c.m.s.). From the resonance structure of the excitation curve of the $\text{Li}^7(p,\alpha)\text{He}^4$ reaction, it was found that the reaction takes place mainly via formation of a Be^8 compound nucleus. The excitation curve has two resonance peaks, at 5.0 and 5.6 Mev. The first can be explained if it is assumed that in the Be^8 nucleus there is a 2^+ level with an excitation energy of 9.9 Mev and a 0^+ level above the resonance range. The second can be explained if the Be^8 nucleus has a level with 24.3 Mev excitation energy of Mev width, even spin and positive parity, most probably 2^+ . There are 4 figures and 9 hard c/p.

radiatsionnykh tumanov i oblachnosti)

PERIODICAL:

Meteorologiya i gidrologiya, 1958, Nr 12, pp 30-32 (USSR)

ABSTRACT:

In the analysis of the data on moisture it must be considered that water dropping down from icicles passes into the solid phase at temperatures below -10° . For this reason the difference between the saturation above ice and water must be corrected in determinations of saturation. In the Rukovodstvo po kratkosrochnym prognozam pogody (Manual for Short-Range Weather Forecasts) Part II, p 110, Table 17 (unfortunately with misprints) values of relative moistures as well as of the temperature differences and the dew point (tochka rosy) are given for the case of a 100 % saturation above ice, practical recommendations, however, are not clearly expressed. Thus, the correction mentioned has not been taken into account in the diagram of the forecast mentioned in the title so that it cannot be applied at temperatures below -10° . Experience has

TITLE: The Causes of Cracks and Breakages in Car Axles (Prichiny obrazovaniya treshchin i izlomov vagonnukh osey)

PERIODICAL: V sb.: Povysheniye iznosostoykosti i sroka sluzhby mashin. Kiyev - Moscow, Mashgiz, 1956, pp 262-270

ABSTRACT: The article describes the results of investigations performed on 3000 pairs of car wheels. As a result of statistical analysis, crack distribution curves were constructed for axles of three standard types. It was discovered that most of the cracks occur at sections near the inside part of the hub. In order to obtain an indication of the magnitude and distribution of the pressures between adjoining elements, tests on twelve sets of samples (shaft and bushing) were performed. It was established that toward the ends of the bushings the pressure is about 30 percent above its average value. A graphical summary of the pressure distribution along the axle was constructed with due consideration to the influence of the additional forces which arise when the car passes

TITLE: Heating of steel billets in molten glass

SOURCE: Kuznechno-shtampovchnoye proizvodstvo, no. 1, 1966, 36-37

TOPIC TAGS: glass, heat carrier, heat treat furnace, metal forging, metal oxidation, metal heat treatment

ABSTRACT: The authors refute the contention of I. I. Gushchina (Kuznechno-shtampovchnoye proizvodstvo, no 4, 1965) and other investigators that heating in molten glass can at present be an effective method of protecting steel against oxidation during reheating prior to its forging and pressing. On the basis of experiments with the heating of steel billets in molten window glass as well as in other types of molten glass at 1000-1450°C for up to 5 hr it is shown that, along with its oxidation-preventing qualities, glass displays major disadvantages such as considerable viscosity and pronounced adhesion to the metal; this leads to a high consumption of glass and causes difficulties during the subsequent cleaning of the metal. During precision dia-forging the remaining glass gets pressed into the surface layers and

Card 1/2

ACC NR: AP6016315

distorts the dimensions of the finished forging. Moreover, the high temperatures in the working area (of the order of 1400°C) result in extremely unfavorable working conditions for the furnace-tending personnel. All this gives reason to believe that, contrary to the published recommendations, this technique of oxidation-free reheating of steel is not practical at present.

TITLE: Cold deformation and annealing of alloy VT15

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 2, 1966, 50-51

TOPIC TAGS: chromium alloy, molybdenum containing alloy, alloy, aluminum containing
alloy / VT15 alloy

ABSTRACT: The cold deformation and the effect of thermal treatment on the structure
and hardness of the cold-deformed alloy VT15 (3% Al, 6.5% Mo, and 10.7% Cr) were
studied. The microstructure of the alloy was determined as a function of the thermal
treatment (annealing followed by quenching in water followed by a second annealing
stage). The mechanical properties of the alloy are compared with the corresponding
properties of steel Kh18N10T, and the experimental results are shown graphically
(see Fig. 1). It was found that an increase in the preliminary degree of deformation
leads to an increase in the maximum hardness of the alloy and activates the aging
processes in the alloy. A further increase in the temperature leads to a decrease
in the hardness of the metal.

2

two maxima, at 225 and 255 nm, the former for all diamonds and the latter only for diamonds containing nitrogen. The coefficient of absorption at long wavelengths (7.8 cm^{-1}) was appreciable (31.5) only for the sample with the maximum nitrogen concentration (1.8×10^{20}). The spectral dependence of the photocurrent does not agree with the spectral dependence of the absorption coefficient, and it is assumed that part of the light of the crystal is absorbed without excitation of the photoconductivity. In the case of large nitrogen content, which may be present in the diamond in the form of layers (rather than individual donors), the photoconductivity may be due to detachment of an electron from the nitrogen atom in the layer.

TITLE: Concerning the radial distribution of electric conductivity in an ionized gas jet

3

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 35, no. 7, 1965, 1262-1264

21

TOPIC TAGS: plasma jet, plasma conductivity, temperature distribution, plasma measurement

QM

ABSTRACT: The authors discuss the effect of the radial distribution of the electric conductivity of a cylinder of ionized gas on the effective conductivity as measured by the loading effect of the ionized gas on a resonant circuit. The effective conductivity as measured in this way is a weighted average of the true conductivity, the weight being proportional to the square of the local electric field strength. It is assumed that the measurements are made in such a way that the electric field strength is proportional to the radius (the distance from the axis of the ionized gas cylinder). The radial distribution of the conductivity is related to that of the temperature by a known equation that obtains for a

Card 1/2

L 60328-65

ACCESSION NR: AP5018306

weakly ionized gas, and the effective conductivities of ionized gas cylinders with different assumed temperature distributions were calculated. Some of these rather simple computations were (successfully) checked by electrolytic tank measurements. It is concluded that the effective conductivity as measured in the assumed manner is more characteristic of the cooler outer portions of the jet than of the hot inner (axial) region. TITLE: Use of antibody neutralization reaction for retrospective diagnosis of tularemia epizootic

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 5, 1964, 50-54

TOPIC TAGS: tularemia, epizootiology, antibody neutralization reaction, bone extract, organ extract, tularemia retrospective diagnosis

ABSTRACT: An intensive tularemia epizootic killed large numbers of rabbits and smaller rodents on Biryuchy Island in the Kherson region in the fall of 1961 and causative agent cultures were isolated from various rodents and ticks by the local laboratory. In May 1962 the preserved remains of field mice which had died of tularemia were found in many burrows during an epizootological investigation of the island. In the present study, bones, dried organs and tissues of 27 field mouse nests were investigated by antibody neutralization reac-

Card 1/3

L 6836-65

ACCESSION NR: AP4039935

tions to find whether tularemia can be diagnosed retrospectively. Thirty-nine extracts were prepared from the bones, organs, tissues, and nest masses. Sheep erythrocytes sensitized with different amounts of tularemia antigen according to Levy and Momot's method were used in the neutralization reactions. A specific antitularemia serum with an agglutination titer of 1:2000, prepared by the Odessa Institute of Epidemiology and Microbiology, was inactivated for 30 min at 56°C before staging the neutralization reactions. Findings show that the presence of a tularemia antigen in extracts of bone, organ, tissue and nest mass can be detected by antibody neutralization reaction. Positive reactions were found for highly diluted organ and whole nest extracts, but were not found for comparably diluted bone extracts which apparently require a greater quantity of antigen for neutralization. The specificity of the latter reaction was confirmed by additional experiments on bone and organ extracts prepared from tularemia infected white mice. Study data demonstrate that the antibody neutralization reaction is highly sensitive and specific in diagnosing tularemia retrospectively. Orig. art. has: 2 tables.

TITLE: Experimental studies of ticks as tularemia vectors

SOURCE: Meditsinskaya parazitologiya i parazitarnyye bolezni, v. 35, no. 3, 1966,
305-309TOPIC TAGS: human disease, animal disease, disease vector, tick, orthopod vector,
tularemia, animal parasite

ABSTRACT:

The tick species *Hyalomma plumbeum plumbeum* and *Haemaphysalis punctata* infected with tularemia occur in nature. The authors infected these species with tularemia under laboratory conditions. The ticks retained the infective agent throughout all stages of development. Nymphs of *H. plumbeum* infected animals with tularemia over an 82-day period, suggesting that these ticks, which are prevalent in the southern steppes, are important in maintaining natural tularemia foci.
